Agenda

1. How does Location Intelligence help businesses assess climate risk?
2. Real-world examples of LI in action
3. How CARTO makes this happen

Most organizations are missing an opportunity...

80%

of all data collected has a
location component

10%

used to power
business decisions

Why does **Where** matter?

- Without **where**, you often can't understand **why**.
- Greater nuance, insight and intelligence behind decision making.
- Post-pandemic, the rules of geography are constantly changing and are continuing to change.
- Location is something we all understand and experience. It's an amazing - and emotive - engagement and communication tool.
- Communicate in a map what would take 1,000 words or 10 bar charts.

Where?

Where are there wildfires?

You're likely

Why?

How can we predict the spread of wildfires based on historical climatology data to understand our exposure to risk?

You need to use an LI Platform

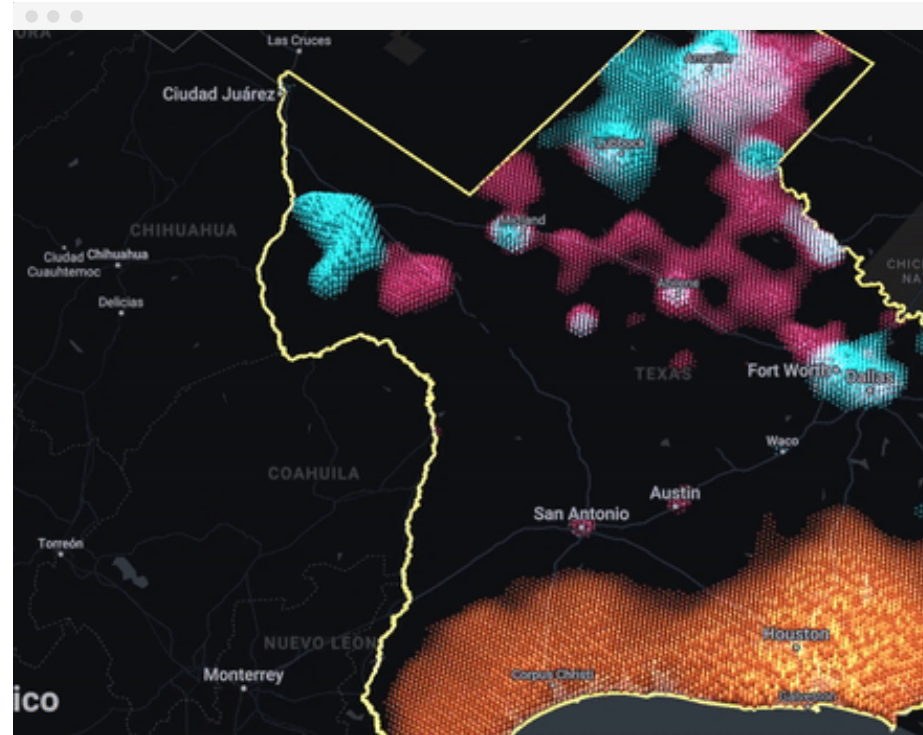

Climate Insights for Every Industry

Public Sector

Transportation departments and government agencies are looking for ways to make more data-driven decisions, especially in response to climate change.

Location Intelligence allows them to:

- Turn climate-related data into actionable insights
- Analyse and prioritise current and future risks to their infrastructure

Smart Cities

Allowing governments to reduce waste and energy consumption, increase eco-friendly public transport options and lower their carbon footprint are some of the key initiatives made possible by spatial data analysis, along with:

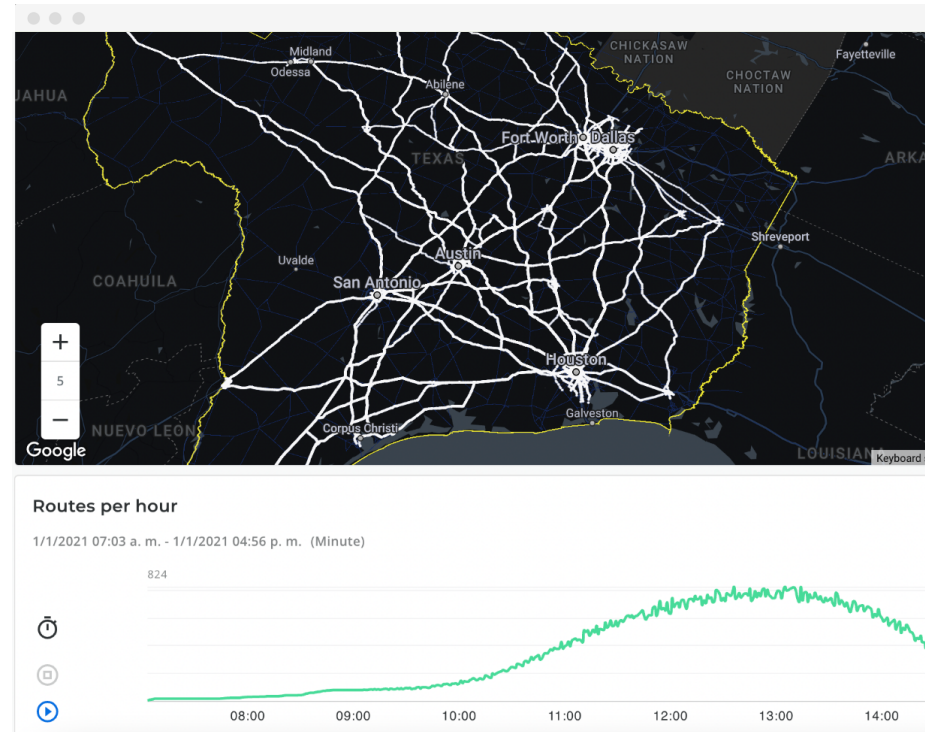

- Traffic management
- EV charging site selection
- Energy management
- Service improvements

Retail & CPG

With the help of Location Intelligence, everything from fleet management to route planning can become not only much more profitable, but also more sustainable. Some of these use cases are:

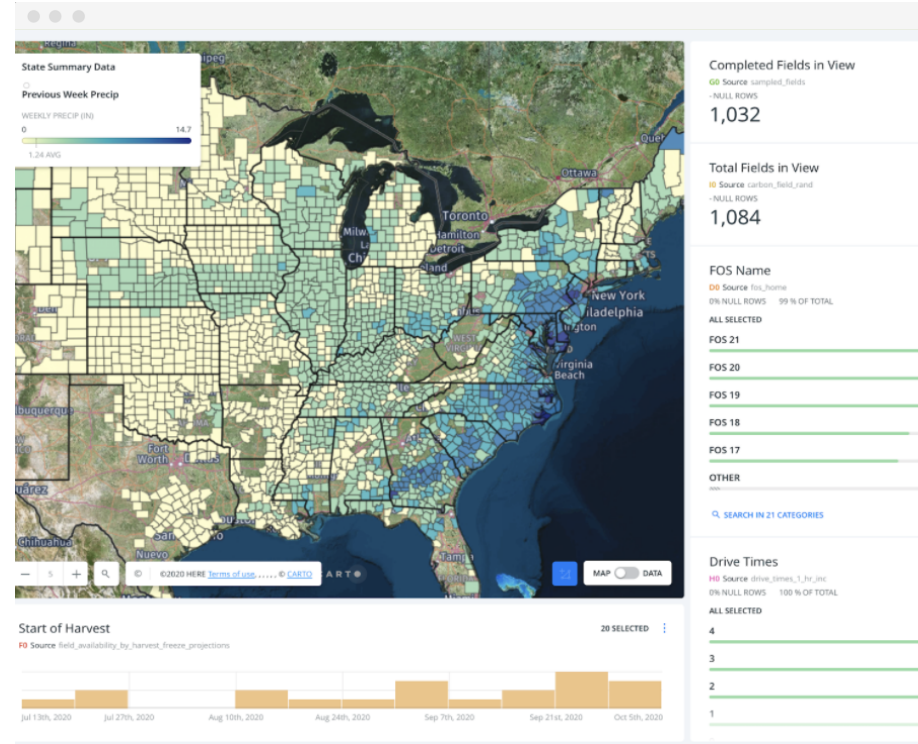

- Sustainable fleet management
- Route optimization for improving speed while decreasing costs

Agriculture

Location Intelligence helps agriculture companies fulfill current demands without compromising the needs of future generations. This is possible with such use cases as:

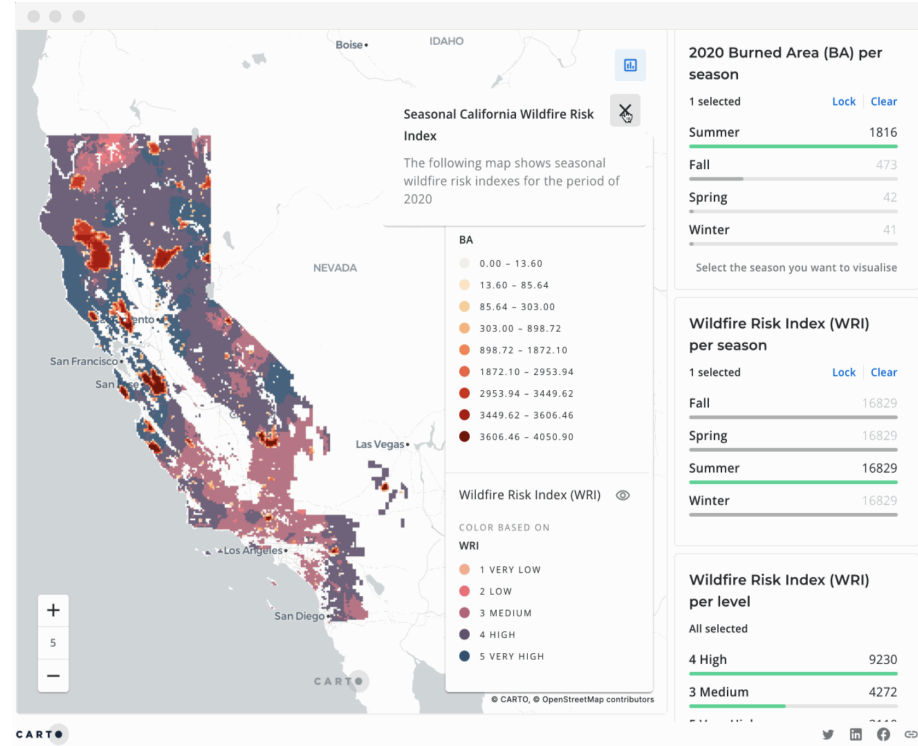

- Climate resilience crop planning
- Spatial data insight-driven field maintenance
- Ensuring food security - producing enough food & mitigating crop failures

Insurance

A growing number of insurance and reinsurance firms are looking to accelerate their investment. Location Intelligence allows them to:

- Identify patterns in risk exposure
- Use analytical methods with geospatial datasets to more rapidly and effectively plan, underwrite, and react.

Real-world examples

WRI

WRI's Resource Watch program needed an easy way to enable a worldwide audience to view timely datasets covering climate change, human health, air quality, energy, water, and more.

- The tool built on CARTO enables users to dive into curated topic pages of data, explore near real-time visualizations and create and share their own unique data visualizations by overlaying individual data sets.

A screenshot of the ResourceWatch website interface. The top navigation bar is dark red with the "RESOURCEWATCH" logo and "Data", "Dashboards", and "BI" menu items. Below the navigation, there are buttons for "ALL DATASETS", "SAVE", and "SHARE". The main content area features a title "Air Quality: Nitrogen Oxide (NO_x) Estimated Emissions" in a pink font, followed by the source "SOURCE: ECCAD-AERIS" and a description: "Anthropogenic nitrogen oxide (NO_x) emission estimates by sector for 2018". Two action buttons are present: "DOWNLOAD FROM SOURCE" with a download icon and "LEARN MORE FROM SOURCE" with an external link icon. Below this is an "Overview" section with a paragraph of text. On the right side, a map visualization shows the West African region with data points overlaid in shades of blue and green, and labels for countries like Morocco, Mauritania, Senegal, Guinea, Sierra Leone, and Liberia.

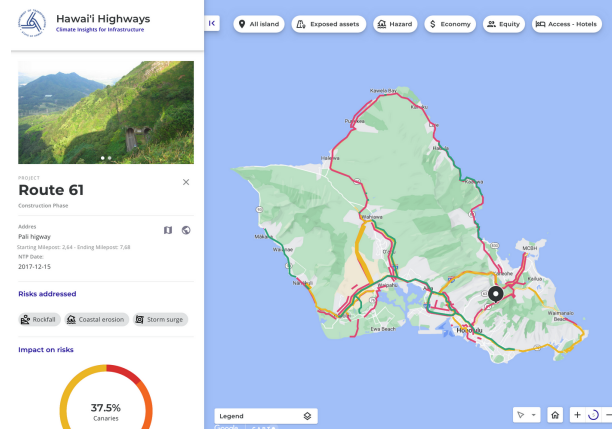

Hawaii Highways

The HDOT Climate Insights for Infrastructure built by CARTO takes advantage of GCP technology for Hawaii Highways.

The tool incorporates self-service Location Intelligence and visualizations, empowering non-technical users to generate powerful insights on the state's climate resilience.

- Hawaii DOT are able to identify elements of the state's transport infrastructure most at risk from climate-related impacts, helping them guide future investment, maintain existing infrastructure and plan for climate-related resilience.

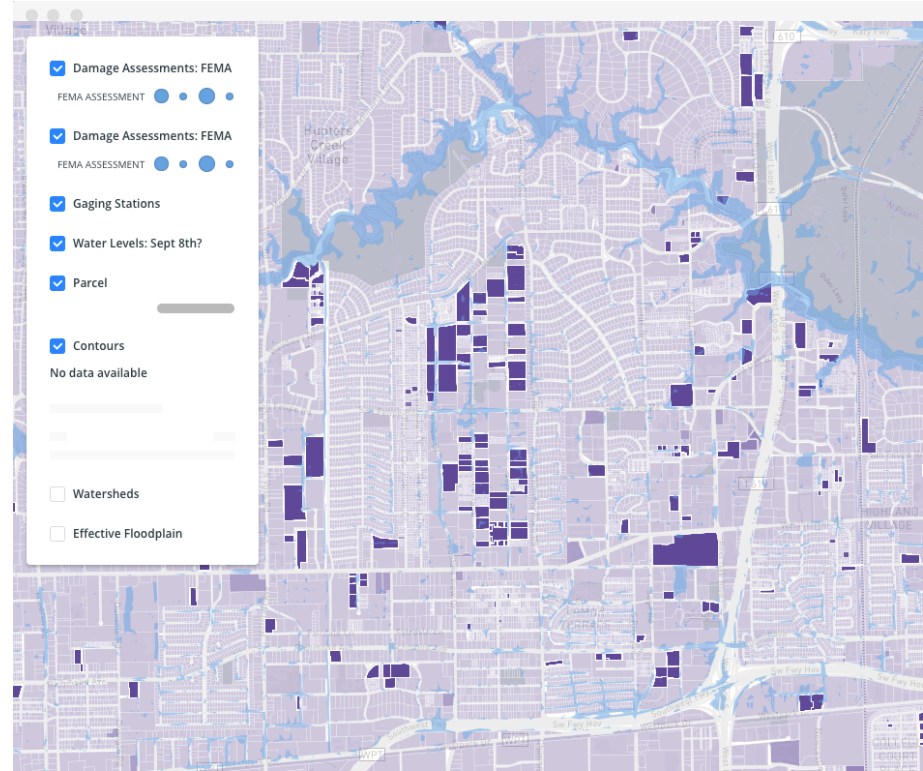

Harris County, TX

Harris County faced a major catastrophe resulting from Hurricane Harvey and needed help with recovery and future disaster planning. They used CARTO to inform citizens and help the County manage recovery efforts, and plan for future climate events.

- County officials can now enhance the accuracy of data in real time, enabling citizens and response teams to plan more effectively, and ensure continued flood monitoring where needed.

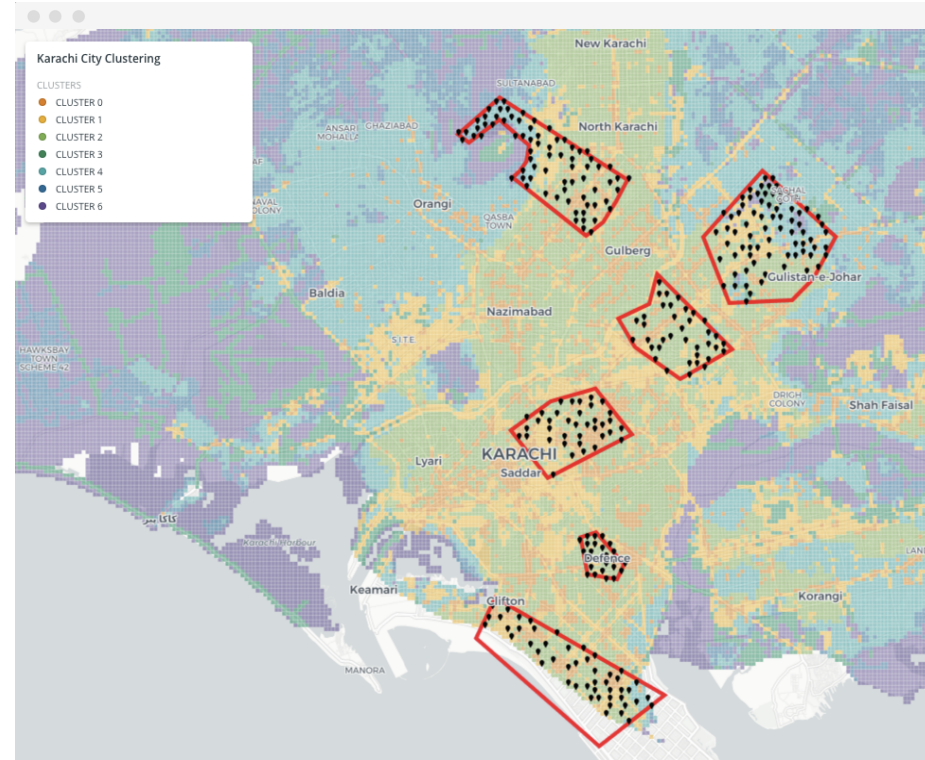

Philip Morris

Philip Morris International's sustainability team uses CARTO to gather location-based behavioral insights on cigarette butt littering, identifying problematic hotspots in cities.

Using CARTO, they can:

- Use external datasets such as POIs & foot traffic to predict where there may be more litter with up-to-date data.
- Visualize data collected as part of the [World Is Not An Ashtray](#) project, monitoring the impact of anti-littering activities.

Learn more [here](#).

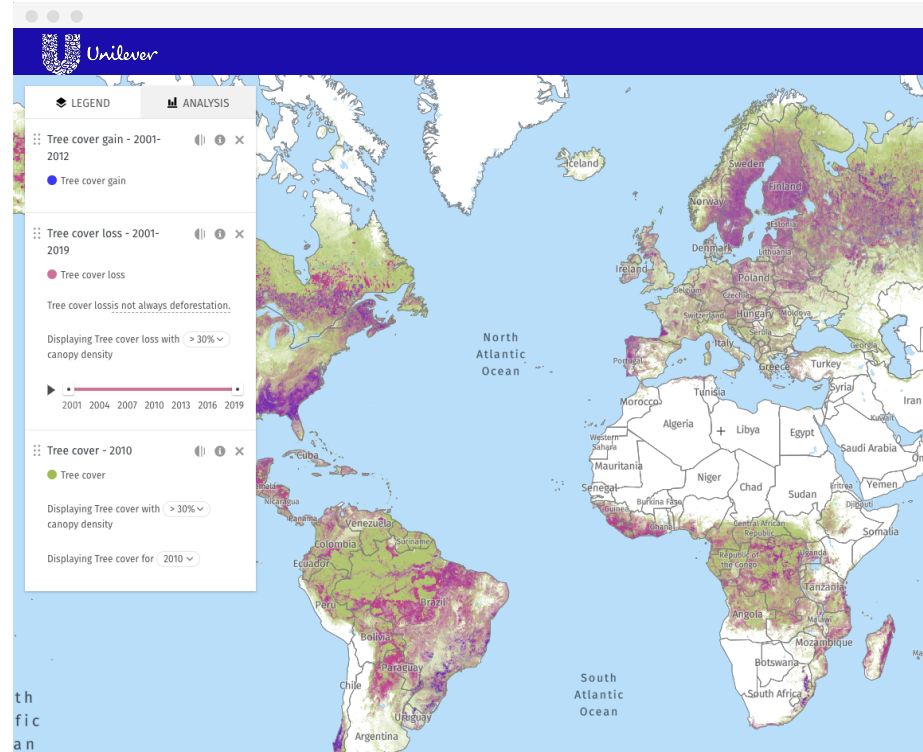

Unilever

Unilever's sustainability team is using CARTO to create and maintain a deforestation tracker as part of their ESG objectives.

The solution brings together a wide range of datasets on deforestation across the globe, providing visualizations and spatial analytics to ensure data driven decision making.

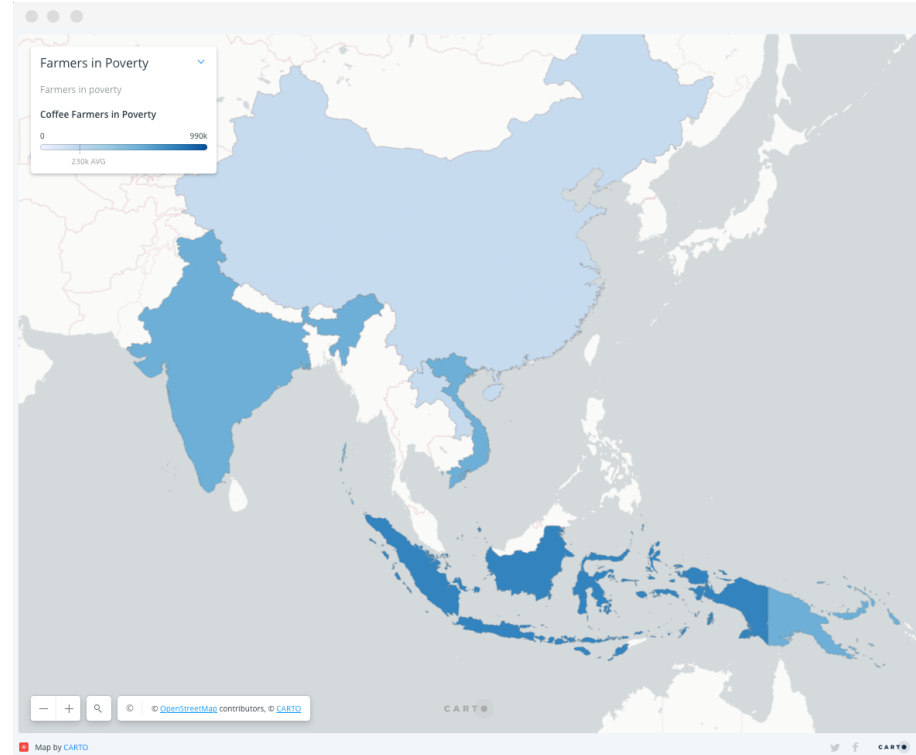

Enveritas

Enveritas

Enveritas is working directly with 400,000 local farmers in Latin America, Africa and Asia to verify sustainability practices.

Using CARTO, Enveritas is able to help coffee farmers visualize the results of their analysis, and to continue their work towards building more sustainable supply chains to help bring farmers out of poverty.

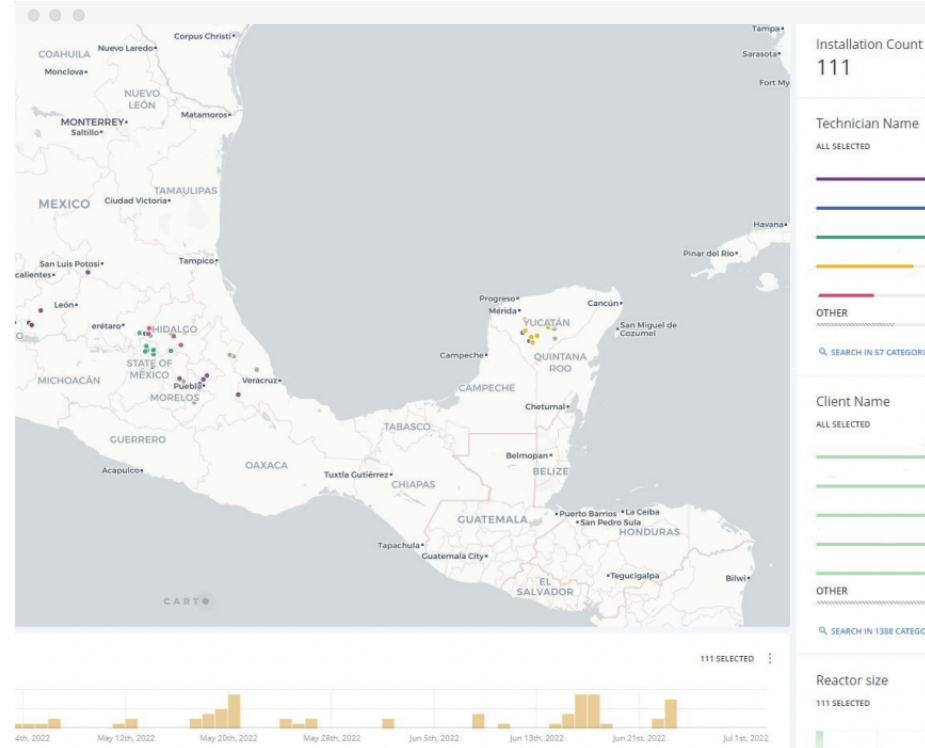

Sistema.bio

Sistema.bio's mission is to drive sustainability through transforming waste into energy, as well as bringing economic, air quality, and waste reduction benefits to smallholder farmers around the world.

Using CARTO's platform, Sistema.bio was able to:

- Visualize all existing and new biodigester installations across the globe
- Analyze current market presence to prioritize field operations & route optimization
- Grow a sustainable footprint by targeting hyper-local geographies to reach new customers

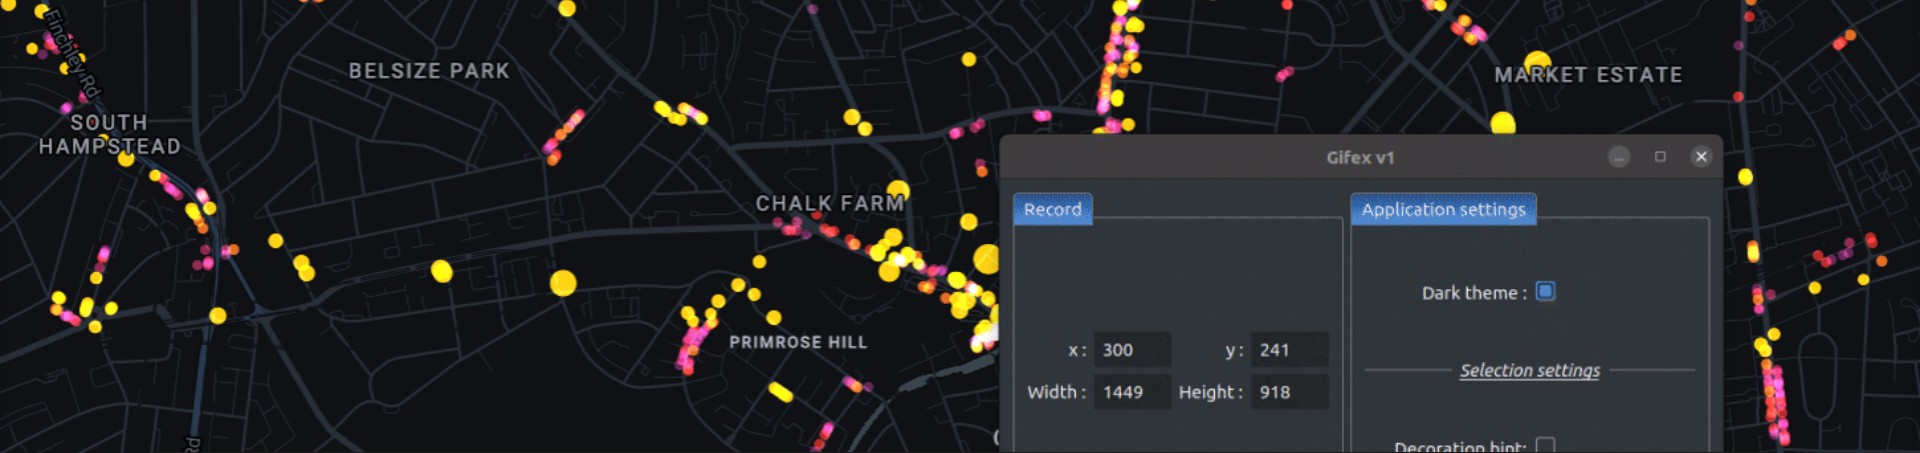

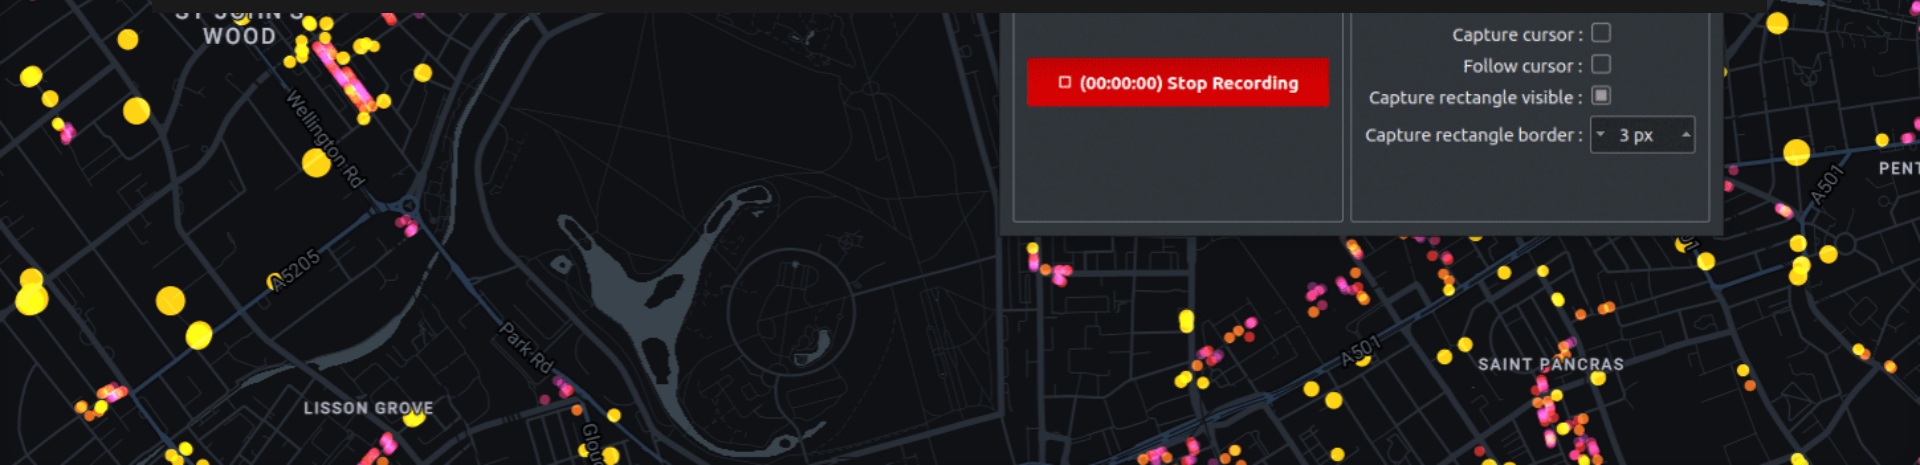

DPD

DPD Ireland use CARTO to optimize their operations by:

- Improving their location data quality with an Address Match Exception App
- Spatially optimizing parcel routing for each depot with an algorithm that takes into account:
 - Vehicle Size
 - Drop off type (B2C vs B2B)
 - Driver shifts
 - Driver experience
 - Speed limits

How does CARTO make this happen?

Cloud-native Location Intelligence

CARTO is a cloud-native Location Intelligence platform.

Our mission is to empower our users with the best data and tools to unlock the power of spatial analytics.

We want to democratize access to Location Intelligence, so it's not just for specialists.

Where

Adds Value

Connectivity

CARTO connects to the cloud data warehouse, tools, and services you already use to simplify your workflow.

Premium Data

Access over 12k datasets from our Data Observatory! We vet providers to provide you with the highest-quality, most accurate and relevant data globally.

Build, Visualize & Share

Browser-based analytics & visualization platform. In-app analysis with SQL and no-code options available; no prior GIS experience needed!

Solve problems

Our Analytics Toolbox and Python integrations make fast, automated and iterative analysis of Big Data easy.

End-to-End Offering

Get access to our whole tech stack with an Enterprise license: APIs, connectors, developer libraries, Python integrations, Location Data Services.

Market-leaders trust CARTO

Jefferies

ARUP

NOVUS

KEARNEY

Posterscope

A 3D point cloud visualization of a terrain, likely a mountain range or a complex landscape. The terrain is rendered in a dark blue color. Several regions are highlighted in a bright cyan color, with yellow outlines. These regions are located in the upper left, center, and lower right. The word "Thanks!" is overlaid in white text in the center of the image.

Thanks!
