i. Preface

This document describes a Feature Type Catalogue extension package for the OGC® ebRIM (ISO/TS 15000-3) Profile of CSW 2.0 [OGC 05-025r3]. It defines the way an ISO 19110 [ISO 19110:2005] Feature Type Catalogue is included within a Registry, and provides an information model and stored queries for such an inclusion.

Suggested additions, changes, and comments on this draft report are welcome and encouraged. Such suggestions may be submitted by email message or by making suggested changes in an edited copy of this document.

The changes made in this document version, relative to the previous version, are tracked by Microsoft Word, and can be viewed if desired. If you choose to submit suggested changes by editing this document, please first accept all the current changes, and then make your suggested changes with change tracking on.

ii. Document terms and definitions

This document uses the specification terms defined in Subclause 5.3 of [OGC 05-008], which is based on the ISO/IEC Directives, Part 2. Rules for the structure and drafting of International Standards. In particular, the word “shall” (not “must”) is the verb form used to indicate a requirement to be strictly followed to conform to this specification.

iii. Submitting organizations

The following organizations submitted this document to the Open Geospatial Consortium Inc.

- University of Nottingham.
- EDINA, University of Edinburgh.
- Science and Technology Facilities Council (STFC).

iv. Document contributor contact points

All questions regarding this document should be directed to the editor or the contributor:

Name	Organization
Kristin Stock (Editor)	Social Change Online, UK and University of Nottingham.
Andrew Woolf (Contributor)	Science and Technology Facilities Council (STFC).

v. Revision history

Date	Release	Editor	Primary clauses modified	Description
18/12/2007	0.1	Kristin Stock	All	Creation of document and content. Addition of example registry content provided by Andrew Woolf (Annex C).

vi. Changes to the OGC Abstract Specification

The OpenGIS® Abstract Specification does not require changes to accommodate the technical contents of this document.

vii. Future work

As a result of the work on this extension package, the following recommendations are made:

- a) It is recommended that the following changes to the FTC model in [ISO 19110:2005] be considered (see Clause 7 for more detail):
 - 1) provision for a simplified option for the expression of feature associations and
 - 2) the removal of the requirement for associations and operations to be strict members of feature types (it is understood that this change is being discussed).
- b) It is recommended that [OGC 05-025r3] be modified to allow the Slots used by an object to be constrained. The current model allows an instance of an object to be created with any slot, containing any slot name and any data type (see Clause 8 for more detail).
- c) It is recommended that an AssociationTypes ClassificationScheme be created to be used across a range of spatial domains to represent the types of associations that may

be used (and could be included within a registry compliant with this extension package). Such a classification scheme may take advantage of existing research developing ontologies of spatial relationships (for example [2], [3]).

Foreword

This document has been created under the auspices of the European Union funded Marine Overlays on Topography for Annex II Valuation and Exploitation (Motiive) project. The component of the project that involved the work described in this document involved Social Change Online UK, HR Wallingford, EDINA, the Science and Technology Facilities Council and the University of Nottingham.

This work does not replace or cancel any other documents, but extends [OGC 05-025r3] with the addition of a Feature Type Catalogue (FTC) compliant with [ISO 19110:2005].

The FTC included in this extension package implements all components of the [ISO 19110:2005], up to and including test module A28, but may also be conformed to partially as with [ISO 19110:2005].

This document includes 3 annexes; Annexes A and B are normative, and Annex C is informative.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The Open Geospatial Consortium Inc. shall not be held responsible for identifying any or all such patent rights.

Recipients of this document are requested to submit, with their comments, notification of any relevant patent claims or other intellectual property rights of which they may be aware that might be infringed by any implementation of the standard set forth in this document, and to provide supporting documentation.

Introduction

This document specifies an extension package to [OGC 05-025r3]. [OGC 05-025r3] includes a basic package, but also allows for the creation of extension packages that build on the basic package and provide additional functionality for a particular purpose.

The purpose of the extension package described in this document is to provide a specification for the inclusion of a semantically-rich Feature Type Catalogue in an ebRIM CSW registry [OGC 05-025r3]. The semantically-rich Feature Type Catalogue (FTC) uses the model described in ISO 19110 (Geographic information – methodology for feature cataloguing) [ISO 19110:2005]. This model includes a range of information about feature types, including attributes, operations, relationships with other feature types, constraints and inheritance mechanisms. This specification includes an information model for such an FTC, describes a mapping to the ebRIM model and explains how such an FTC can be stored using the ebRIM objects, and specifies a number of stored queries that can be used to access the content of the FTC. This extension package includes all components of the [ISO 19110:2005], up to and including test module A28, and provides sufficient information to allow the reader to create a Feature Type Catalogue that is compliant with [ebRIM], [OGC 05-025r3] and [ISO 19110:2005].

The FTC is intended to provide a representation that will allow inheritance, the representation of operations and links between operations and attributes. This conceptual representation of the feature type catalogue is considered separate from the other components of the registry that implement the FTC operations (that is, web services) and feature types (that is, data sources).

This extension package was created under the auspices of the Marine Overlays on Topography for Annex II Valuation and Exploitation (Motive) project to allow feature types from the marine domain to be represented and navigated. However, the specification is generic and applies to feature types from all geospatial domains.

OGC® Feature Type Catalogue Extension Package

for ebRIM (ISO/TS 15000-3) Profile of CSW 2.0

1 Scope

This OGC® document specifies the Feature Type Catalogue extension package for the ebRIM (ISO/TS 15000-3) Profile of CSW 2.0 [OGC 05-025r3], based on ISO 19110 Geographic information – methodology for feature cataloguing [ISO 19110:2005], in order to allow the creation of catalogues containing semantically-rich Feature Type Catalogues.

This OGC® document is applicable to feature types from all geospatial domains.

This OGC® document specifies the content and access mechanisms for a Feature Type Catalogue that includes attributes, operations, relationships between feature types and constraints. It supports inheritance, links between feature type operations and web services and links between operations and the attributes that they use, affect or are affected by. It fully implements [ISO 19110:2005] up to and including test module A28.

2 Compliance

Compliance with this specification shall be checked using all the relevant tests specified in Annex A (normative). This document described a Feature Type Catalogue that is based on [ISO 19110:2005], and that standard specifies a number of different conformance classes to allow the creation of different levels of catalogue. Although this specification is designed to describe implementation of a full catalogue, it can also be used to implement a less complete catalogue according to the conformance classes described in [ISO 19110:2005]. Annex A contains test cases and test modules for each of the conformance classes to reflect [ISO 19110:2005]. Table 1 identifies the inclusions in each conformance class in [ISO 19110:2005] and this extension package.

Table 1 — Conformance Classes

Attributes	Associations	Operations	Properties associated with multiple features	Inheritance relationships included	[ISO 19110:2005] test module	FTC extension package test module
X	-	-	-	-	A.17	A.15

4 Terms and definitions

For the purposes of this specification, the definitions specified in Clause 4 of the OWS Common Implementation Specification [OGC 05-008] shall apply. In addition, the following terms and definitions apply.

4.1

feature

abstraction of real world phenomena with common properties [ISO 19110:2005]

4.2

feature association

relationship that links instances of one feature type with instances of the same or a different feature type [ISO 19110:2005]

4.3**feature attribute**

characteristic of a feature [ISO 19110:2005]

4.4**feature operation**

operation that every instance of a feature type may perform [ISO 19110:2005]

4.5**feature type catalogue**

catalogue containing definition and descriptions of the feature types, feature attributes and feature associations occurring in one or more sets of geographic data, together with any feature operations that may be applied ([ISO 19110:2005], but referred to there as a feature catalogue)

4.6**web service**

distinct part of the functionality that is provided by an entity through interfaces [ISO 19110:2005]

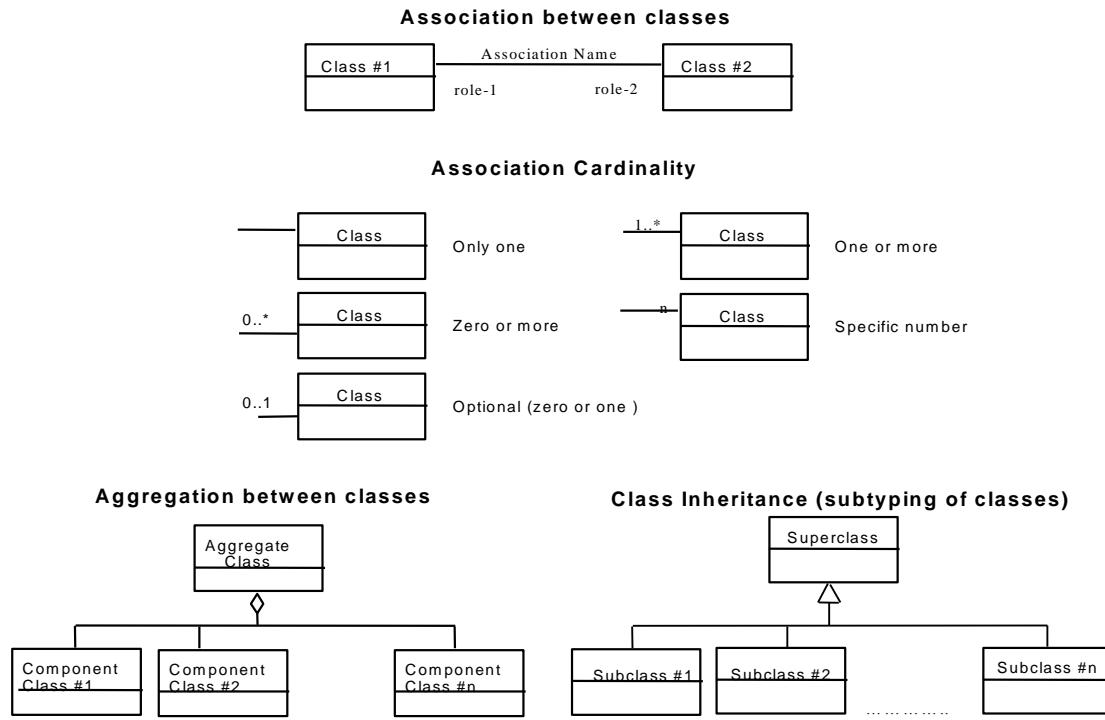

5 Conventions

5.1 Abbreviated terms

CSW	Catalogue Service for the Web
ebRIM	ebXML Registry Information Model
FTC	Feature Type Catalogue
ISO	International Standardisation Organisation
OGC	Open Geospatial Consortium
UML	Unified Modeling Language

5.2 UML notation

Most diagrams that appear in this specification are presented using the Unified Modeling Language (UML) static structure diagram. The UML notations used in this standard are described in the diagram below.

**Figure 1 — UML notation**

In this standard, the following stereotypes of UML classes are used:

- <<Interface>> A definition of a set of operations that is supported by objects having this interface. An Interface class cannot contain any attributes.
- <<DataType>> A descriptor of a set of values that lack identity (independent existence and the possibility of side effects). A DataType is a class with no operations whose primary purpose is to hold the information.
- <<CodeList>> A flexible enumeration that uses string values for expressing a list of potential values.
- <<Inherited>> A data element (attribute or slot) that is inherited from some other standard. This includes:
 - Attributes that are included in ISO 19110 [ISO 19110:2005] and are modeled in the information model for this extension package using an attribute from one of the ancestor ebRIM [ebRIM] classes.
 - Slots that are inherited from the [OGC 05-025r3] Basic Package.

Inherited data elements are prefixed with the appropriate namespace. Data types are not shown for these data elements since the data type is inherited.

- e) <<Slot>> An attribute that is included in [ISO 19110:2005] and is modeled in the information model for this extension package by creating an instance of the Slot class from ebRIM. The attribute names shown in the UML diagram for attributes with a Slot stereotype are those that would be used in Slot.name. Data types shown in the UML diagram for attributes with the Slot stereotype are those that would be used in Slot.slotType.
- f) <<AssociationType = ‘x’>> An association, depicted as a UML Association or Aggregation that maps to an ebRIM Association class and populates the AssociationType attribute in the instance of that class with association type x.
- g) <<Classification>> An attribute that is implemented as an instance of a rim::Classification class, containing a value from the classification scheme specified in the data type.

5.3 Namespace prefix conventions

Table 2 lists the namespaces used in this document and the specifications in which they are defined. The prefixes are **not** normative and are merely chosen for convenience; they may appear in examples without being formally declared, and have no semantic significance. The namespaces to which the prefixes correspond are normative however.

Table 2 — Namespace mapping

Prefix	Namespace URI	Specification
rim	urn:oasis:names:tc:ebxml-regrep:xsd:rim:3.0	OASIS ebRIM 3.0 [ebRIM]
wrs	http://www.opengis.net/cat/wrs	CSW ebRIM profile [OGC 04-021r3]
csw	http://www.opengis.net/cat/csw	CSW part of OGC Catalogue Services 2.0.2 [OGC 05-025r3]

6 Feature Type Catalogue Extension Package Overview

The Feature Type Catalogue (FTC) extension package specifies a number of specialized components in the [ebRIM] information model, and was created using the method described in [1]. Figure 2 provides a very simple conceptual model of the main components of the FTC.

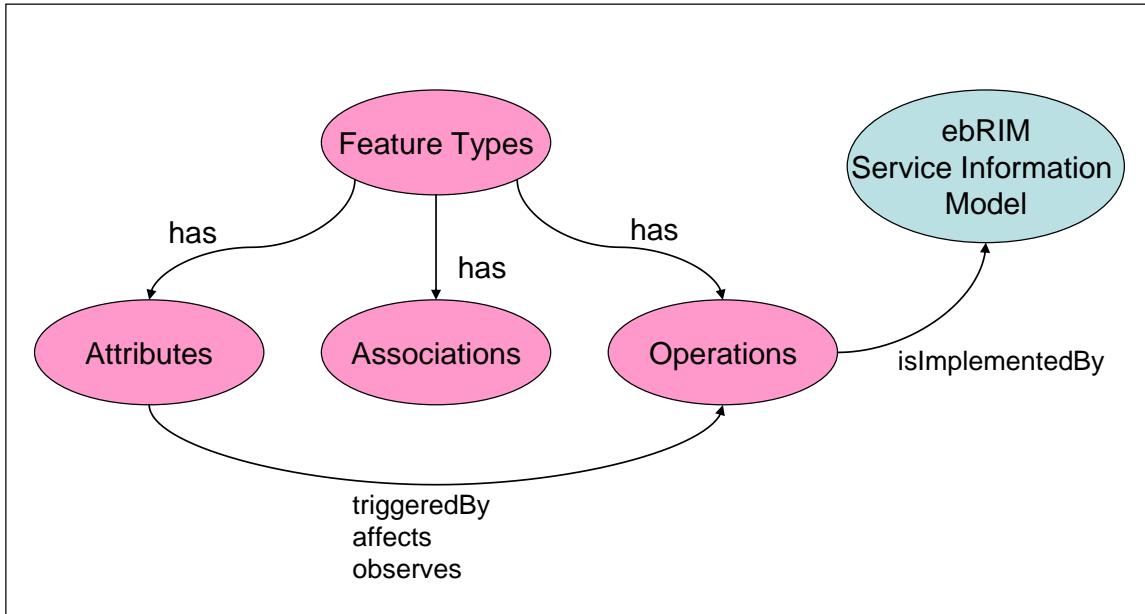

Figure 2 — Feature type catalogue overview

The FTC extension package information model includes these components as specializations of the ebRIM ExtrinsicObject class, and also includes a range of associations.

The package defines mappings from [ISO 19110:2005] into the ebRIM model, and illustrates how the FTC information model can be used to represent FTC content in a registry that complies with [OGC 05-025r3].

The extension package also includes a number of defined queries that allow content of the FTC to be queried using the [OGC 05-025r3] interface.

Each of these parts of the extension package is described in more detail in subsequent clauses.

7 Feature Type Catalogue Information Model

Figure 3 is a UML diagram of the FTC from [ISO 19110:2005] as an extension of the [ebRIM] information model.

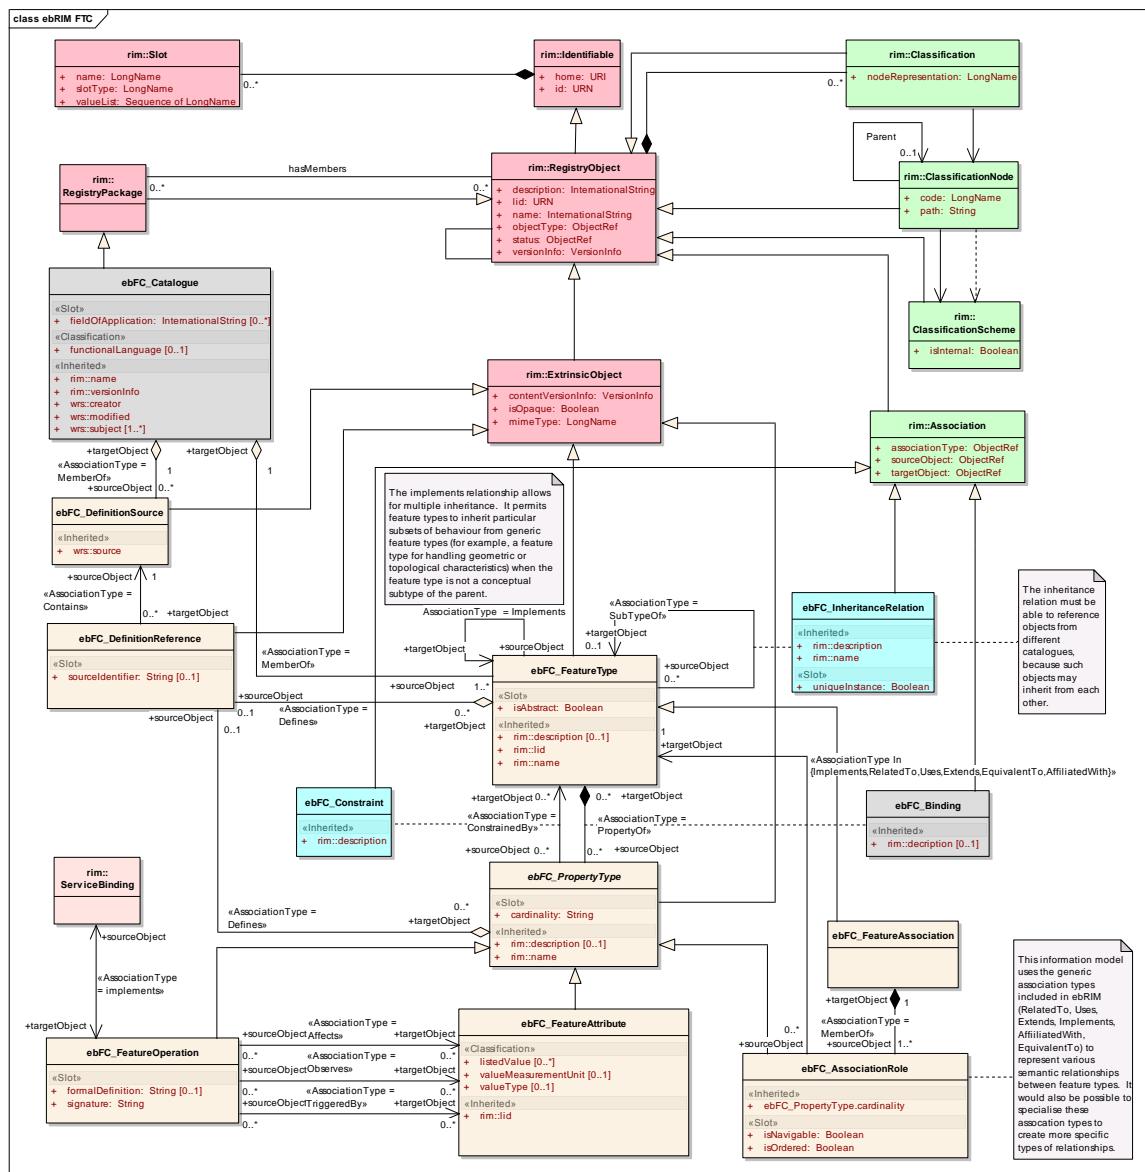

Figure 3 — Feature type catalogue information model

Those components that are added to the information model by this extension package all have names of the form ebFC_*. The methodology taken to perform this mapping conformed to [1]. In summary:

- Classes from [ISO 19110:2005] were modeled as specializations of the most appropriate ebRIM class. New classes were specializations of rim::ExtrinsicObject, rim::Association and/or rim::RegistryPackage, sometimes through other intermediate classes.
- Attributes from [ISO 19110:2005] were mapped to existing ebRIM attributes where possible. These are indicated with the <>Inherited>> stereotype in Figure 3.

- Attributes from [ISO 19110:2005] that had an enumerated set of possible values were mapped to a Classification Scheme. These are indicated with the <<Classification>> stereotype in Figure 3.
- Where mapping to an ebRIM attribute was not possible, attributes from [ISO 19110:2005] were mapped to slots (instances of the ebRIM Slot class). These are indicated with the <<Slot>> stereotype in Figure 3.

The [ebRIM] classes shown in Figure 3 (depicted with the rim:: namespace and shown in green and pink) show their attributes, but attributes that are listed in the [ebRIM] specification but that represent relationships with other classes (references) are not explicitly listed.

Relationships between the classes that are created as part of the extension package are modeled in Figure 3 using the [ebRIM] Association class, unless they are specialization relationships and are then handled by the structure of the model itself. In Figure 3, these instances of the Association class are shown as UML Associations (lines) with a stereotype indicating the AssociationType value to be used in the [ebRIM] Association class and source and target objects labeled appropriately. In cases where there are additional attributes attached to the association, these are modeled as specializations of the UML Association Class (for example, ebFC_Binding adopts the ebRIM Association class with AssociationType = PropertyType, and adds an extra description attribute).

The mapping adopts data types from [ebRIM], since that specification includes a defined set of data types, while [ISO 19110:2005] does not explicitly list valid data types. [ISO 19110:2005] data types have been mapped to the closest equivalent [ebRIM] data type.

Table 3 provides a mapping from each component of [ISO 19110:2005] into an [ebRIM] object.

Table 3 — Mapping from ISO 19110 to ebRIM

ISO 19110 Class	Representation in this Extension Package	ISO 19110 Attribute	Representation in this Extension Package

		valueType	rim::Classification using Classification Scheme TypeName.
FC_AssociationRole	Specialisation of ebFC_PropertyType, with new ObjectType = 'ebFC_AssociationRole',	cardinality	Inherited from ebFC_PropertyType
		type	rim::Association.AssociationType between ebFC_AssociationRole and ebFC_FeatureType.. ISO 19110 provides a limited set of types of association, but this extension package allows any of the existing ebRIM AssociationTypes to be used, or new AssociationTypes created.
		isOrdered	Slot
		isNavigable	Slot
		Role relation	The rim::Association between ebFC_AssociationRole and ebFC_FeatureAssociation with AssociationType = 'MemberOf'.

		Role valueType	The rim::Association between ebFC_AssociationRole and ebFC_FeatureType with AssociationType in ‘RelatedTo’, ‘Uses’, ‘Extends’, ‘EquivalentTo’, ‘AffiliatedWith’.
FC_FeatureAssociation	Specialisation of ebFC_FeatureType, with new ObjectType = ‘ebFC_AssociationRole’,	Role role	The rim::Association between ebFC_AssociationRole and ebFC_FeatureAssociation with AssociationType = ‘MemberOf’.
FC_DefinitionSource	Specialisation of rim::ExtrinsicObject, with new ObjectType = ‘DefinitionSource’	source	wrs::source from Basic Package
FC_DefinitionReference	Specialisatoin of rim::ExtrinsicObject, with new ObjectType = ‘DefinitionReference’	sourceIdentifier	Slot
		Role definitionSource	The rim::Association between ebFC_DefinitionReference and ebFC_DefinitionSource with AssociationType = ‘Contains’.
FC_ListedValue	rim::Classification		
FC_BoundFeatureAttribute	Three specializations of rim::Association between ebFC_FeatureOperation and ebFC_FeatureAttribute, one for each relationship type (triggeredBy, affects, observes).		

This table and Figure 3 show only the attributes that were specified in [ISO 19110:2005] for each class. However, inheritance that is built into the specialization relationship dictates that the child classes inherit all of the attributes from their parents, not just those listed. Those attributes inherited but not shown in Figure 3 would not be populated unless mandatory.

The [ISO 19110:2005] model for associations between feature types was modeled faithfully in the FTC extension package, but it was found to be complicated and difficult to understand and implement in a real world situation. Therefore, consideration of a simplified version is recommended for practical implementation purposes.

The [ISO 19110:2005] model for associations requires that those associations are properties of a feature type and not independent entities. This can be problematic in some practical implementation situations because it may be desirable to have a set of feature types defined in one catalogue by one information community, another set of feature types implemented in another catalogue by another information community, and finally, a set of associations between the two feature types from different catalogues represented in a third catalogue and governed by a third information community. The associations between feature types that are of interest may be specific to an information community. The same argument applies to operations, in that some operations relate to many feature types and thus may not be correctly viewed as members of the properties of that feature type. It is therefore recommended that the issue of operation and association membership of a feature type be further explored.

8 Creation of the Information Model in the Registry

Table 4 describes how each of the elements of the information model is implemented in an [ebRIM] registry. Annex B also contains the [OGC 05-025r3] Publication interface Transaction Insert operation that may be used to create the information model in a registry. This is applied to a registry after the basic [ebRIM] model had been created and the [OGC 05-025r3] has been installed to make the relevant operations available.

Table 4 — Creation of the Registry

Extension Package Element	Method for Creation in ebRIM Registry
New classes (excluding association classes and conceptual classes)	New classes are defined as sub-classes (sometimes to more than one level of specialisation) of rim::ExtrinsicObject. These are added by extending the canonical ObjectType ClassificationScheme and adding new nodes to represent the new classes. Inheritance is accommodated by defining sub-classes as children of other classes within the extension package where appropriate (for example, ebFC_FeatureAttribute is a child of ebFC_PropertyType, which is a child of rim::ExtrinsicObject. Once the new classes have been included in the ObjectType ClassificationScheme, new instances of them can be created.
Conceptual classes (excluding conceptual association classes)	Conceptual classes are implemented as instances of the class that they conceptually specialize, using existing ebRIM mechanisms for inheritance of attributes and creation of new slots.
Conceptual association classes	New association classes are implemented as instances of rim::Association. These association classes are used in Figure 3 to depict associations from [ISO 19110:2005] that have additional attributes over and above those normally included in an Association. However, it is not necessary to create specializations of Association because all attributes are either inherited from rim::Association or its parents, or are implemented as Slots and thus also inherited. Therefore no explicit action is required to allow association classes to be included.
Inherited attributes	No explicit action is required to allow attributes that are inherited from a parent to be included in a child.
Attributes that are classifications	New classification schemes and their nodes are defined for the attribute values, after which new object instances can be created that reference the classification nodes.
Inherited slots	The Basic Package (wrs) adds a number of Slots to the ebRIM Slots ClassificationScheme. No further action is required to use these, as new object instances may reference them using the appropriate wrs namespace.
New slots	New slots are created as additional nodes in the ebRIM Slots ClassificationScheme.
New association types	New association types are added to the ebRIM canonical AssociationType ClassificationScheme. They can then be referenced by instances of the rim::Association class throughout the model.

Figure 3 contains 4 classes that are shown in a grey shade. These classes are not explicitly implemented in the FTC. They are conceptual classes and are mapped from particular concepts in the [ISO 19110:2005], but when implemented in XML, they do not appear as explicit classes. This is because the main mechanism for creating new objects in ebRIM involves creating specializations of ExtrinsicObject, and the classes shaded in grey are specializations of other [ebRIM] classes. Such an approach is permitted by the

use of the Slot mechanism to model additional attributes. In a registry implementation, all classes in the FTC information model are created as instances of some [ebRIM] class, usually with an ObjectType that matches the class name (beginning with ebFC_). The grey shaded classes are exceptions to this in that they adopt the ObjectType of the class that they specialize. This is reflected in the new nodes that are created in the [ebRIM] ObjectType ClassificationScheme. The XML documents in the Annexes provide examples of this.

A deficiency that was discovered in the process of creating this extension package was the inability to constrain slots for a particular class. The [ebRIM] and [OGC 05-025r3] models as they exist do not provide any mechanism for assigning a particular slot to a particular class. Any slot may be added to any class in the information model. The Slots classification scheme merely provides a set of slots that may be used. It is recommended that [OGC 05-025r3] be extended to allow constraints to be created on the slots available to a class.

This extension package has taken advantage of existing Association Types where possible, and thus these have remained fairly generic. There is scope to create a more detailed hierarchy of Association Types that accommodate the types of relationships that may be of interest in a spatial domain. It is recommended that such a hierarchical classification be created to be used across a range of spatial domains. For example, the [ebRIM] RelatedTo AssociationType covers a range of different types of association, and may be further classified into a range of more specific types of relationships.

9 Stored Queries

In addition to the information model and the mechanism to create the FTC model in an [OGC 05-025r3] registry, the extension package defined in this document includes a number of stored queries. These are inserted into the registry as AdHoc Queries, and allow a user to retrieve the contents of the FTC. Table 5 summarizes these queries, and Annex B includes the XML definitions that may be inserted into the registry to allow retrieval (for example, using the [OGC 05-025r3] GetRecords operation).

Table 5 — Stored Queries

QueryName	Parameters	Returns
getFeatureTypes	Feature Type id	FeatureType records with specified id.
getFeatureTypeAttributes	Feature Type id	FeatureAttribute records for the feature type with the specified id.
getFeatureTypeOperations	Feature Type id	FeatureOperation records for the feature type with the specified id.
getFeatureOperationServiceBindings	Feature Operation id	Service Binding records that are linked to the feature operation with the specified id and their related Association record.
getFeatureOperationAttributes	Feature Operation id	FeatureAttribute records that are linked to the feature operation with the specified id and their related Association record.

QueryName	Parameters	Returns
getFeatureTypeAssociations	Feature Type id	FeatureAssociation records for the feature type with the specified id.
getInheritingFeatureTypes	Feature Type id	FeatureType records that inherit from (are children of) the feature type with the specified id.
getInheritedFeatureTypes	Feature Type id	FeatureType records that pass characteristics to (are parents of) the feature type with the specified id.
getImplementingFeatureTypes	Feature Type id	FeatureType records that implement (behave like) the feature type with the specified id.
getImplementedFeatureTypes	Feature Type id	FeatureType records that are implemented by (get behaviour from) the feature type with the specified id.

Annex A (normative)

Abstract test suite

A.1 Introduction

This normative Annex presents the abstract test suite for evaluating conformance to this specification. Clauses A.2 to A.14 contain test cases that are based on each of the components and contents of the Feature Type Catalogue. Clauses A.15 to A26 contain test modules that can be used to test a useful subset of functionality that a catalogue may provide, as described in [ISO 19110:2005]. These test cases and test modules are adapted from [ISO 19110:2005].

A.2 Test case for existence and form of a feature type catalogue package

Information for the test case is as follows:

- a) test purpose: to verify the existence and form of a feature type catalogue package that is used to contain a collection of feature types that relate to a particular domain;
- b) test method: check whether a rim::RegistryPackage object exists that contains the mandatory attributes (from the conceptual ebFC_Catalogue class) and to which all ebFC_DefinitionSource and ebFC_FeatureType objects in the package are linked through a ‘MemberOf’ Association;
- c) reference: Clause 7, Figure 3 and Clause 7, Table 3;
- d) test type: basic.

A.3 Test case for general requirements

Information for the test case is as follows:

- a) test purpose: to verify that general requirements are met;
- b) test method: check the following:
 - 1) whether all instances of ebFC_FeatureType, ebFC_FeatureAttribute, ebFC_FeatureAssociation, ebFC_AssociationRole and ebFC_FeatureOperation are identified by a name that is unique within the FTC package;

- 2) whether all attributes shown in Figure 3 with the Classification stereotype reference ClassificationNodes from a Scheme in the same or some other RegistryPackage;
- 3) whether all instances of ebFC_FeatureType, ebFC_FeatureAttribute, ebFC_FeatureAssociation, ebFC_AssociationRole and ebFC_FeatureOperation either have a populated value for rim::description, or reference a definition from another source through ebFC_DefinitionSource;
- 4) whether all instances of ebFC_FeatureType, ebFC_FeatureAttribute, ebFC_FeatureAssociation, ebFC_AssociationRole and ebFC_FeatureOperation that have a populated value for rim::lid use a unique value for that attribute;
- c) reference: Clause 7, Figure 3 and Clause 7, Table 3;
- d) test type: capability.

A.4 Test case for the ebFC_Catalogue class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_Catalogue class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.5 Test case for the ebFC_FeatureType class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_FeatureType class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
 - 5) run the getFeatureTypes stored query to ensure that correct results are returned;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.6 Test case for the ebFC_InheritanceRelation conceptual association class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the rim::Association class that implement the ebFC_InheritanceAttribute conceptual association class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);

- 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
- 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
- 5) run the getInheritedFeatureTypes and getInheritingFeatureTypes stored queries to ensure that correct results are returned
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.7 Test case for the ebFC_FeatureOperation class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_FeatureOperation class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
 - 5) run the getFeatureTypeOperations, getFeatureOperationServiceBindings and getFeatureOperationAttributes stored queries to ensure that correct results are returned;
 - c) reference: Clause 7, Figure 3;

- d) test type: capability.

A.8 Test case for the ebFC_Binding conceptual association class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the rim::Association class that implement the ebFC_Binding conceptual association class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.9 Test case for the ebFC_Constraint conceptual association class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the rim::Association class that implement the ebFC_Constraint conceptual association class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);

- 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
- 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
- 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
 - c) reference: Clause 7, Figure 3;
 - d) test type: capability.

A.10 Test case for the ebFC_FeatureAttribute class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_FeatureAttribute class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
 - 5) run the getFeatureTypeAttributes stored query to ensure that correct results are returned;
- c) reference: Clause 7, Figure 3;

- d) test type: capability.

A.11 Test case for the ebFC_AssociationRole class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_AssociationRole class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
 - 5) run the getFeatureTypeAssociations; getImplementingFeatureTypes and getImplementedFeatureTypes stored queries to ensure that correct results are returned;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.12 Test case for the ebFC_FeatureAssociation class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_FeatureAssociation class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);

- 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.13 Test case for the ebFC_DefinitionSource class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_DefinitionSource class;
- b) test method: check the following:
- 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.14 Test case for the ebFC_DefinitionReference class

Information for the test case is as follows:

- a) test purpose: to verify that the required information is included and the required structure is used in instances of the ebFC_DefinitionReference class;
- b) test method: check the following:
 - 1) test each instance of the object to ensure that it contains only those slots and attributes shown in Figure 3 (ebRIM itself does not constrain this);
 - 2) test every instance attribute shown in Figure 3 and verify that the correct semantics, obligation/condition, cardinality and type are satisfied (ebRIM itself does not constrain this);
 - 3) test every instance attribute shown in Figure 3 with a Classification stereotype to ensure that it references a Classification Node in an appropriate Classification Scheme (ebRIM itself does not constrain this);
 - 4) test every association between the instance of the object and other related objects to ensure that the correct sourceObject, targetObject, associationType, and attributes are included, that the correct cardinalities are satisfied for the association and that the correct semantics, obligation/condition, cardinality and type are satisfied for the attributes;
- c) reference: Clause 7, Figure 3;
- d) test type: capability.

A.15-A.26 Test Modules

Table A.1 describes the Test Modules. More background information is available in ISO 19110. All test modules reference Clause 7, Figure 3, and all test modules are of test type capability.

Table A.1 — Test modules

Module	Title	Purpose	Test cases to perform within the module.
A.15	Test module for a catalogue with single-use feature attributes.	Verify that the feature catalogue supports core representation functionality; comprised of feature types and feature attributes that are unique to a feature type.	A.2, A.3, A.4, A.5, A.9, A.10, A.13, A.14

Module	Title	Purpose	Test cases to perform within the module.
A.16	Test module for a catalogue with single-use feature attributes and association roles.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes and association roles that are unique to a feature type.	A.15 + A.11, A.12
A.17	Test module for a catalogue with single-use feature attributes and association roles and operations.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes, association roles and feature operations that are unique to a feature type.	A.16 + A.7
A.18	Test module for a catalogue with multi-use feature attributes.	Verify that the feature catalogue supports core representation functionality; comprised of feature types and feature attributes that may be members of multiple feature types.	A.15 + A.8
A.19	Test module for a catalogue with multi-use feature attributes and association roles.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes and association roles that may be members of multiple feature types.	A.16 + A.8
A.20	Test module for a catalogue with single-use feature attributes and association roles and operations.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes, association roles and feature operations that that may be members of multiple feature types.	A.17 + A.8
A.21	Test module for a catalogue with single-use feature attributes and inheritance.	Verify that the feature catalogue supports core representation functionality; comprised of feature types and feature attributes that are unique to a feature type, plus inheritance.	A.15 + A.6
A.22	Test module for a catalogue with single-use feature attributes and association roles and inheritance.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes and association roles that are unique to a feature type, plus inheritance.	A.16 + A.6
A.23	Test module for a catalogue with single-use feature attributes and association roles and operations and inheritance.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes, association roles and feature operations that are unique to a feature type, plus inheritance.	A.17 + A.6
A.24	Test module for a catalogue with multi-use feature attributes and inheritance.	Verify that the feature catalogue supports core representation functionality; comprised of feature types and feature attributes that may be members of multiple feature types, plus inheritance.	A.18 + A.6
A.25	Test module for a catalogue with multi-use feature attributes and association roles and inheritance.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes and association roles that may be members of multiple feature types, plus inheritance.	A.19 + A.6

Module	Title	Purpose	Test cases to perform within the module.
A.26	Test module for a catalogue with single-use feature attributes and association roles and operations and inheritance.	Verify that the feature catalogue supports core representation functionality; comprised of feature types, feature attributes, association roles and feature operations that that may be members of multiple feature types, plus inheritance.	A.20 + A.6

Annex B (normative)

XML Transaction to Create the Feature Type Catalogue

In addition to this document, this specification includes a [OGC 05-025r3] Transaction Insert operation to create the relevant components in an ebRIM registry that has the [OGC 05-025r3] interface installed.

B.1 Transaction Insert

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<Transaction xmlns:rim="urn: oasis:names:tc:ebxml-regrep:xsd:rim:3.0"

Annex C (informative)

Example Feature Type Catalogue Content

C.1 Introduction

This annex provides example XML documents that illustrate how content may be inserted into an FTC that complies with this specification, once the Insert statement contained in Annex B.1 has been used to describe the FTC.

This example inserts several packages into the registry. It illustrates how content should be packaged up and how different packages can reference each other.

C.2 The GML Package

```

 <rim:Name>
 <rim:LocalizedString value="Observation"/>
 </rim:Name>
 <rim:Description>
 <rim:LocalizedString value="An observation is an act through which a number, term or other symbol is assigned to a phenomenon [FOW1998]. An observation is associated with a discrete time. The phenomenon is a property of an identifiable object, which is the feature of interest of the observation. The observation uses a procedure, which is often an instrument or sensor [NRC1995] but may be a process chain, human observer, an algorithm, a computation or simulator. The key idea is that the observation result is an estimate of the value of some property of the feature of interest, and the other observation properties provide context or metadata to support evaluation, interpretation and use of the result."/>

<rim:LocalizedString value="In conventional measurement theory [e.g. KRALST, SAR1995, VIM] the term "measurement" is used for the concept. However, Fowler's distinction between measurement and category-observation [FOW1998] has been adopted in more recent work [NIE2001, YOD] so the term "observation" is used here for the general concept. "Measurement" may be reserved for cases where the result is a numeric quantity."/>

<rim:LocalizedString value="The relationship between the properties of an observation and those of its feature of interest is key to the semantics of the model.: Observation model takes a user-centric viewpoint, emphasizing the semantics of the feature-of-interest and its properties. This contrasts with Sensor oriented models, which take a process- and thus provider-centric viewpoint."/>

<rim:Description>
<rim:LocalizedString value="The resultTime is the time when the procedure associated with the observation act was applied."/>

```

For some observations this is identical to samplingTime, in which case the resultTime may be omitted.

Example: Where a measurement is made on a specimen in a laboratory, the samplingTime should record the time the specimen was retrieved from its host, while the resultTime should record the time the laboratory procedure was applied.

Example: Where sensor observation results are post-processed, the resultTime is the post-processing time, while the samplingTime preserves the time of initial interaction with the world.

Example: Simulations are often used to estimate the values for phenomena in the future or past. The samplingTime is the real-world time that the result applies to, while the resultTime is the time that the simulation process was executed."/>

```

This will typically be used to record environmental parameters, or event-specific sampling parameters that are not tightly bound to either the feature-of-interest or the procedure.

NOTE: Parameters that are tightly bound to the procedure should be recorded as part of the procedure description. For example, the SensorML model associates parameters with specific process elements or stages.

NOTE: The semantics of the parameter must be provided as part of its value.

In some applications it is convenient to use a generic or standard procedure, or feature-of-interest, rather than define an event-specific process or feature.

In this context, event-specific parameters are bound to the Observation act."/>

      <rim:Description>
        <rim:LocalizedString value="The Climate Science Modelling Language (CSML) provides a standards-based semantic model and encoding for representing a range of conceptual information classes of relevance to climate science."/>
        <rim:LocalizedString value="Physical processes occur in the natural world across a wide spectrum of spatial and temporal scales, and considerable science informs the design of experimental sampling strategies. It should be no surprise, conversely, that the geometry and topology of observation sets are a fundamental determinant of the scientific uses to which they may be put. Moreover, the properties of the instruments used to generate data themselves place constraints on their interpretation (e.g. as regards accuracy, precision, calibration, required post-processing, etc.)."/>
        <rim:LocalizedString value="These two factors – the scientific utility of a sampling regime, and the limitations of an observing process – lead to a natural, scientifically important, classification of data types along these axes. Quite often the two are highly correlated (certain instruments generate certain samplings), and so scientific communities of practice adopt more abstract conceptual information classes that nevertheless reflect artefacts of sampling or instrument-type. This is particularly evident in the climate sciences, where broad information classes based on measurement-set geometry and topology have almost universal acceptance. Thus, CSML feature types are classified primarily around geometric and topologic structure, and not the semantics of the observable or measurand."/>
      <rim:LocalizedString value="CSML provides 13 feature types, is compliant to the OGC Observations and Measurements model, and incorporates behavioural aspects through the 'processing affordance' pattern."/>
      <rim:LocalizedString value="Further details of CSML are available at: http://ndg.nerc.ac.uk/csml"/>
